Except internal speakers, end users are purchasing external speakers and headphones. There are different types of speakers or headphones, from standard devices which are cheap, to gaming devices which are really expensive. When you plug your speakers or headphones in audio 3.5" jack on your computer or notebook, you will see that speakers or headphones are active on taskbar. In case your speakers or headphones are not plugged in, you will be red X on your speakers, on taskbar. To be sure that your speakers or headphones are not faulty, we are recommending you to check are they working on another computer or notebook. If you do not have another computer or notebook you can test speakers or headphones on your smartphone. Yes, it's possible to simultaneously use headphones and speakers at the same time in Windows 10 without having to install additional programs. Steps to use both headphone and speaker at the same time. If the Default Device option is missing or greyed out, then it's likely because the speaker is already the default audio device on your PC, and you can skip to the next step. Also, you will see Default Device entry just below the device, as shown in the picture above. Step 4: Switch to the Recording tab by clicking on the same. If both headphone and speaker are not playing the sound at the same time, please check if you have actually set Speaker as the default device (and not default communication device). Filed Under: Windows 10 Tagged: Tips. Related Articles. Sound issues on a Windows PC are annoying. If your speakers aren't working, here's how to fix it and get sound back on your computer. To unmute your audio, start by playing an audio or video file. This will help you spot the audio is working again. Next, identify the mute button on your keyboard, and tap it. On a multimedia style keyboard, this will usually be along the top, alongside other playback controls. Whether you're using wired headphones or a set of speakers with your PC, they will be connected to the computer with a traditional 3.5mm jack. This should be connected to the audio out socket. Correctly plugging the jack into the correct port is vital for getting some noise out of your computer. On older systems, a microphone port can be found beside the speaker/headphone socket.
